Retrospective Test of Trend Projections for Severity Ratios

Attached is a retrospective test of the predictive accuracy of various trend procedures. Please note that instead of using ultimate loss ratios, as in Exhibit 11a, Exhibit 11b uses ultimate severity ratios, i.e., ultimate loss ratios adjusted by dividing out the frequency component. Please note that our analysis is limited to Policy Years 1988 through 1999, the years for which frequency data is available.

Results for both indemnity and medical are shown using both linear and exponential fits. All possible combinations of from four to ten data points, which permitted a test of the projected severity ratio three years hence, were used. Our current review trends policy year 1999 3.25 years, policy year 1998 4.25 years, and policy year 1997 5.25 years. An average of those three values is then calculated.

Current estimates of policy year ultimate severity ratios are compared with predicted values based on trending through earlier years. The results are available for each of twenty-one loss development approaches - incurred and paid-to-2nd through paid-to-20th, as well as the average of the incurred and paid-to-20<sup>th</sup> methods, although the paid-to-9<sup>th</sup>, paid-to-11th, paid-to-13<sup>th</sup>, paid-to-15<sup>th</sup>, paid-to-17th and paid-to-19<sup>th</sup> approaches are not shown.

As an illustration, the incurred loss development approach generated an indemnity severity ratio of 0.9160 for policy year 1996. Fitting the loss ratios for policy years 1990 to 1993 using a straight line and projecting that to 1996 yielded a loss ratio of 0.9603 which overstates our current estimate for 1996 by 0.0443 points.

**Indemnity****Actual Ultimate Severity Ratios****Including Average of Paid and Incurred**
